

Swiggy Sales Analysis Report

Problem Statement

You have been given a dataset from Swiggy, India's leading food delivery platform, that handles orders across various food categories including Veg and Non-Veg dishes from restaurants spanning multiple cities and states. The dataset contains details about the products, orders, customers, and relevant dates. The task is to analyze this dataset to uncover key insights related to sales trends, customer behavior, and product performance, and to help the company improve its sales strategy and optimize customer satisfaction.

Dataset Description

The analysis is based on a single consolidated dataset:

Swiggy Data — 197,430 records containing State, City, Order Date, Day, Quarter, Week, Restaurant Name, Location, Category, Dish Name, Food Type, Price (INR), Rating, and Rating Count.

The dataset was loaded into Excel via Power Query and analyzed using Pivot Tables and an interactive dashboard.

Objective

The objective of this analysis is to answer the following key business questions:

Total Revenue — Identify the overall revenue generated from food orders
Average Order Value and Rating — Evaluate customer spending and satisfaction levels
Monthly Sales Performance — Examine how sales fluctuate across the months of 2025
Top Products by Revenue — Determine which food categories are the top revenue generators
Customer Spending Analysis — Understand how much customers are spending on average per order
Sales Performance by Top 5 Cities — Track the sales performance across leading cities
Top 10 Cities by Number of Orders — Find out which cities are placing the highest number of orders
Daily and Weekly Trends — Analyze how revenue varies across days of the week and weeks of the year
Revenue Comparison Between Food Types — Compare revenue generated by Veg vs Non-Veg categories
Product Popularity by Occasion — Identify which categories perform best across the dataset

Key Insights

1. Total Revenue and Orders: Swiggy processed 197,430 orders from January to August 2025, generating a total revenue of Rs. 53,012,506. The average order value stands at Rs. 268.51, reflecting an accessible, high-frequency ordering pattern across a wide customer base.
2. Average Rating: The platform maintained an average customer rating of 4.34 out of 5 consistently across all three quarters — Q1 (4.342), Q2 (4.340), and Q3 (4.342). This

stability reflects uniform service quality and reliable restaurant performance throughout the year.

3. **Monthly Sales Performance:** Revenue remained stable across all eight months, ranging from Rs. 6.27M (February) to Rs. 6.83M (January). February recorded the lowest monthly revenue while January peaked. The consistency indicates a mature, steady customer base with limited seasonal volatility in food delivery demand.
4. **Top Categories by Revenue:** The top revenue-generating category is Recommended at Rs. 7,188,937, followed by Main Course (Rs. 760,045), Burger Combos — 3 Pc Meals (Rs. 507,774), McSaver Combos — 2 Pc Meals (Rs. 431,697), and Desserts (Rs. 416,311). The Recommended category alone contributes over 13.5% of total revenue, underscoring the power of algorithmic recommendations in driving orders.
5. **Customer Spending Analysis:** With an average spend of Rs. 268.51 per order, customers demonstrate high-frequency, everyday ordering behavior. This presents an opportunity to increase average order value through combo offers, upsells, and loyalty-based incentives.
6. **Sales Performance by Top 5 Cities:** The top 5 cities by revenue are Bengaluru (Rs. 5,456,798), Lucknow (Rs. 3,117,360), Hyderabad (Rs. 3,021,712), Mumbai (Rs. 3,015,573), and New Delhi (Rs. 2,829,181). Bengaluru is the dominant market, generating 80% more revenue than the second-ranked city and contributing 10.3% of total revenue on its own.
7. **Top 5 States by Orders:** The highest order volumes come from Karnataka, Uttar Pradesh, Telangana, Maharashtra, and Delhi — closely mirroring the city-level rankings and confirming the concentration of demand in metro and tier-1 regions.
8. **Daily Sales Trend:** Saturday generates the highest daily revenue at Rs. 7,782,935, followed by Thursday (Rs. 7,664,619) and Sunday (Rs. 7,638,004). Tuesday records the lowest sales at Rs. 7,359,414. The weekend spike confirms strong leisure-driven ordering behavior among Swiggy's customer base.
9. **Revenue Comparison Between Food Types:** Veg orders dominate with Rs. 34,180,398 (64.5% of total revenue), while Non-Veg contributes Rs. 18,832,108 (35.5%). This reflects India's large vegetarian consumer base and suggests an opportunity to expand premium Veg product offerings across more cities.
10. **Quarterly Performance Summary:** Q1 (Rs. 19,667,822 across 73,096 orders) and Q2 (Rs. 19,902,257 across 74,163 orders) performed almost identically, indicating a highly stable and predictable first half of the year. Q3 covers only July and August as a partial quarter, recording Rs. 13,442,427 across 50,171 orders.

Recommendations

Focus marketing and restaurant acquisition efforts in Bengaluru, which alone contributes over 10% of total revenue, while expanding reach in fast-growing tier-2 cities.

Launch mid-week promotions targeting Tuesday and Wednesday to address the daily revenue dip and improve delivery utilization during lower-demand periods.

Leverage the Recommended category's dominance by continuing to invest in personalized recommendation algorithms, as this single category drives more revenue than the next eight categories combined.

Introduce premium Veg combo bundles to capitalize on the 64.5% Veg revenue share and increase average order value beyond the current Rs. 268.51 baseline.

Promote the platform's consistent delivery performance and 4.34 average rating in marketing communications to build customer trust and drive first-time user conversions.

Use quarterly data consistency (Q1 vs Q2 parity) for reliable demand forecasting, enabling better restaurant partner planning, staffing, and inventory management ahead of each quarter.

Expand Non-Veg category promotions in cities like Hyderabad and Lucknow where Non-Veg demand is traditionally stronger, to capture untapped revenue potential in those markets.

Conclusion

The analysis of Swiggy's 2025 data — spanning 197,430 orders, 28 cities, and 28 states across January to August — reveals a business that performs consistently throughout the year with strong concentration in metro markets. Bengaluru leads all geographies, Veg dominates food type revenue, and the Recommended category drives a disproportionate share of total sales. With a stable average rating of 4.34, predictable quarterly performance, and weekend-driven order spikes, Swiggy is well-positioned to grow further by targeting high-demand cities, optimizing mid-week performance, and leveraging data-driven personalization more aggressively in the months ahead.
